## Verktøy for nettplanlegging under usikkerhet

Per-Oddvar Osland, forskningsleder i Glitre Nett  
Susanne Sandell, forsker i SINTEF Energi

# Effektanalyse – grunnlag for nettplanlegging

# Kva er makslast (kWh/h) til ein kunde?

- Velanders formel

$$P_{max} = k_1 \cdot W + k_2 \cdot \sqrt{W}$$

- Brukstid

$$P_{max} = W / \text{brukstid}$$

(W = årsforbruk, kWh)

- Statistisk modell

Regresjonsanalyse

- Stokastisk modell

Regelmessige mønster +  
stokastisk variasjon

- Maskinlæring

Maks last basert på  
inputdata og trening

→ **Framtidig maks?**

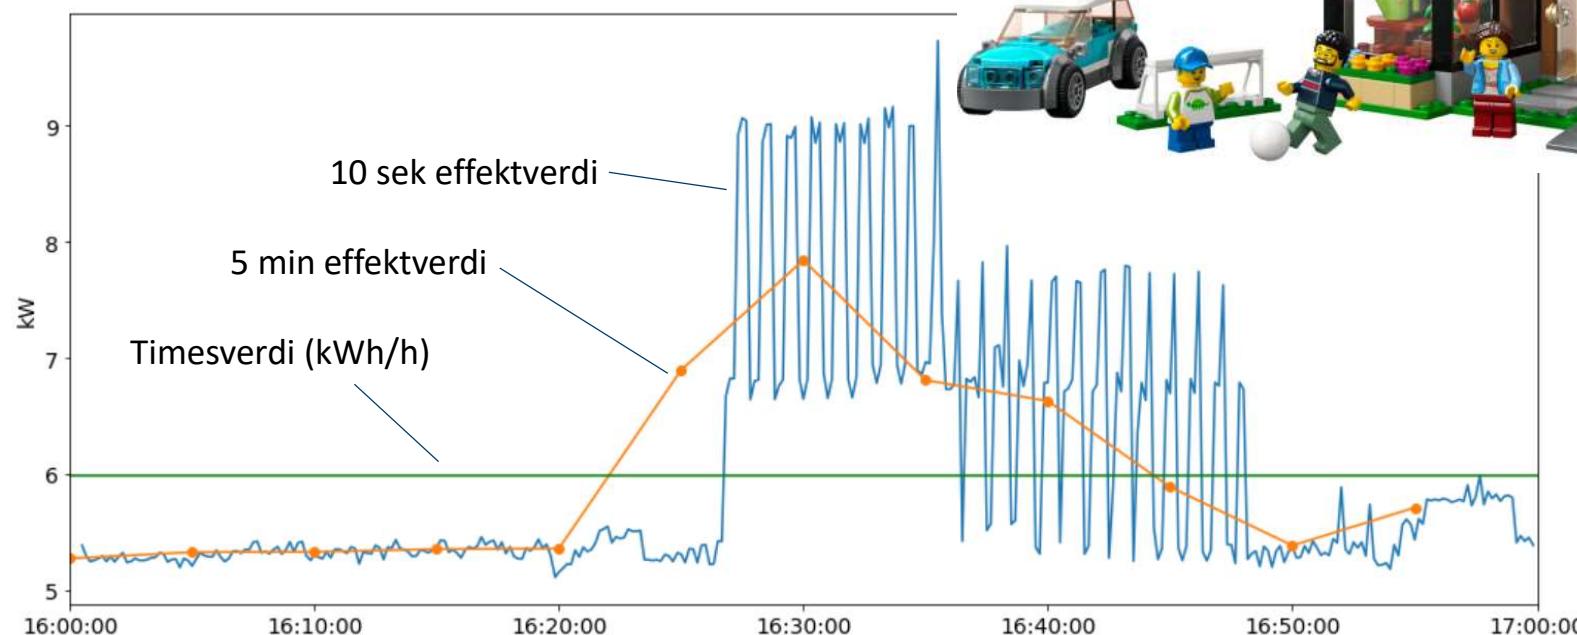

**CINELDI**

# Kva for ein modell er best?

Modell	Pluss	Minus
<b>Velanders formel</b>	Enkel og velkjent	Underestimerer makslast
<b>Brukstid</b>		Upresise estimat
<b>Statistisk modell (regresjonsanalyse)</b>	Beste modell - mest presis! 	Krev parameter tilpassing
<b>Stokastisk modell</b>	Modellerer heile året	Mykje modellering
<b>Maskinlæring</b>	Nest beste modell, presis	Risiko for overtilpasning (lite robust)

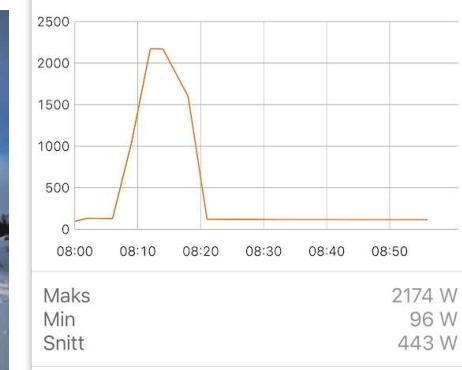

# Timesmåling vs momentanlast

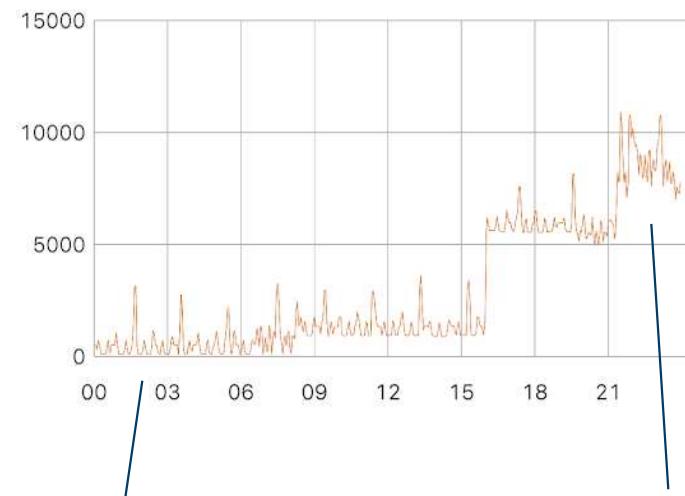

**CINELDI**

# Observasjon - kundetypar

- Husholdningsforbruk og hytteforbruk har ulik effektvariasjon – Hytter har i større grad høge effektverdiar innanfor ein time
- Husholdning og næring er like når det gjeld høge verdier innanfor ein time

# Observasjon – høg vs lav last

Lav last:

Maks momentaneffekt =  
**2 x timesverdi**

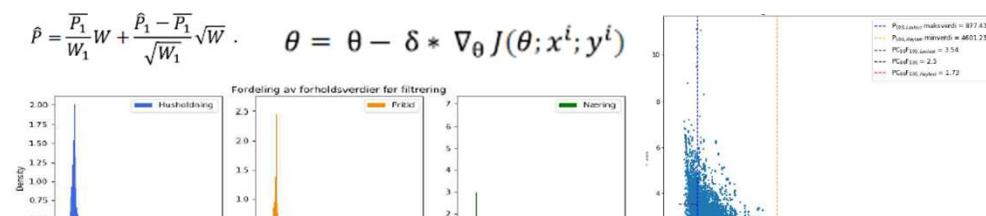

Høg last:

Maks momentaneffekt =  
**1,5 x timesverdi**

# Sluttrapport, Pilot Effektanalyse

<https://www.sintef.no/projectweb/cineldi/pilot-projects-in-cineldi/risk-based-distribution-network-planning/>

$$\hat{P}_{i,y} = k_1 W_{i,y} + k_2 \sqrt{W_{i,y}},$$

$$\hat{B}_y = (1 - \varepsilon) \frac{W_{i,y+1}}{\tau}.$$

$$v_i(n) = \left( \frac{\sum_{n=1}^{N_i} w_i(n)}{N_i} \right) M_{w_i(n),m} \overline{M_{i,m}} (U_{w_i(n),h} \overline{U_{i,h}} + H_{w_i(n),h} \overline{H_{i,h}}), \forall n.$$

$$\hat{P}_{i,y} = \bar{P}_{i,y} + k \sigma_{i,y}, \quad \hat{A}_y = k_1 (1 - \varepsilon) W_{i,y-1} + k_2 (1 - \varepsilon) W_{i,y-1}.$$

# Strategi *Risikoavers*: Forsterk nettet

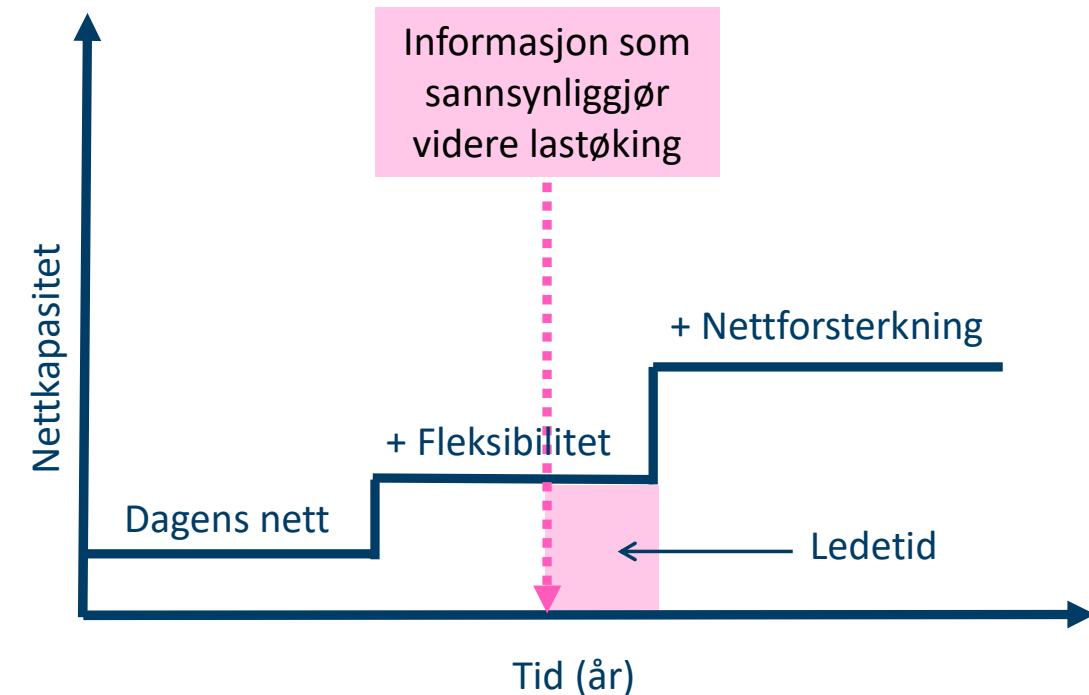

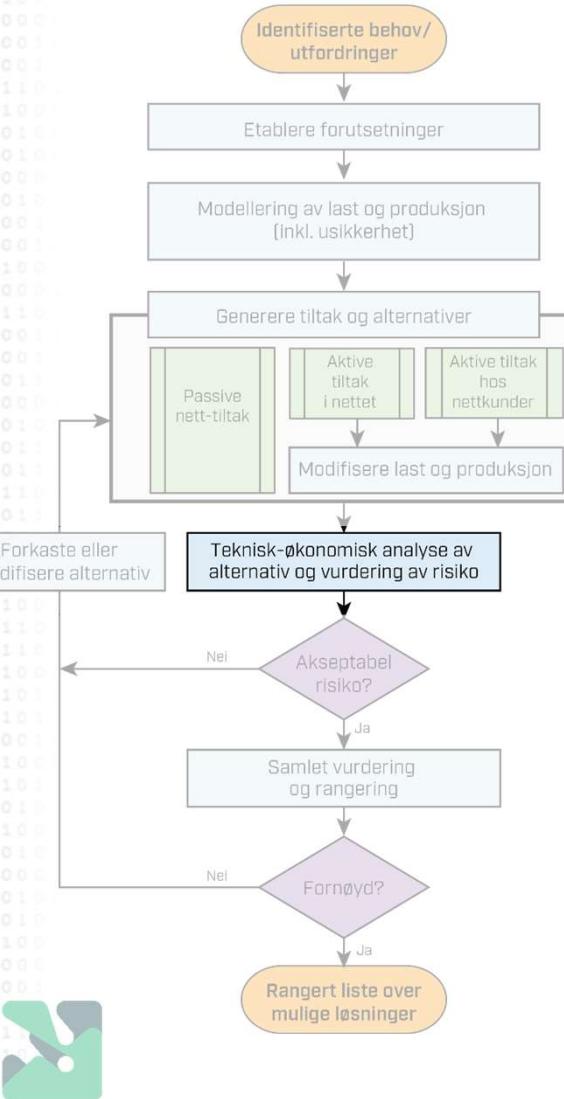

# Strategi *Risikovillig*: Vent-og-se

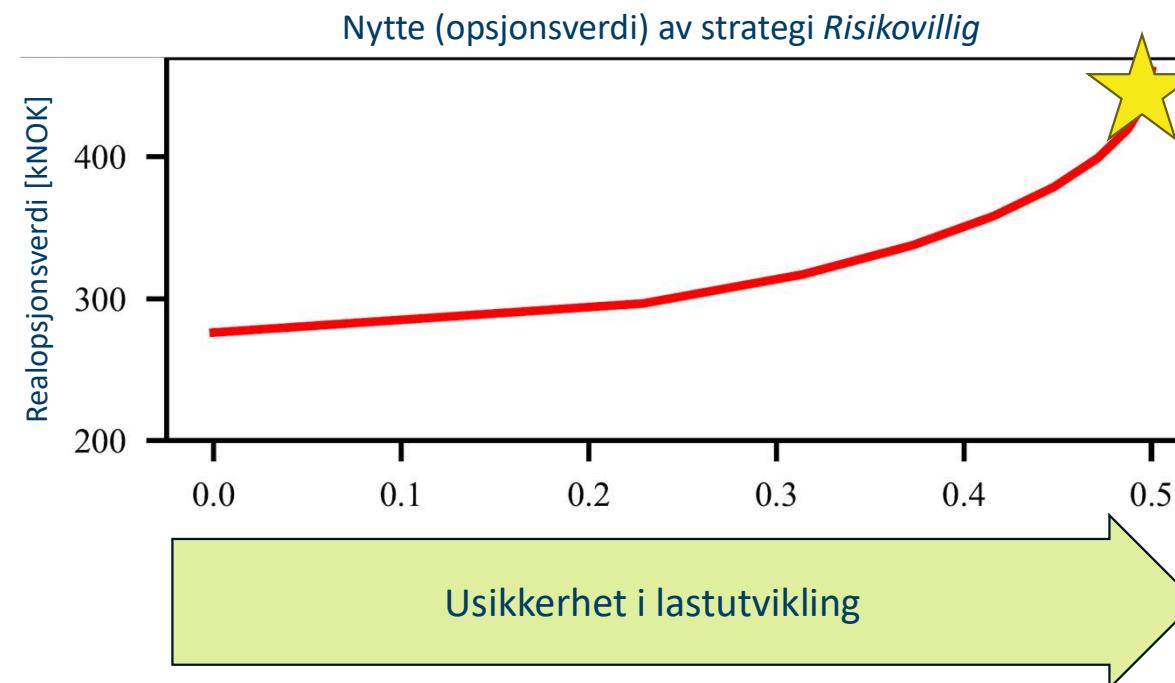

# Strategi *Risikovillig*: Vent-og-se

# Strategi *Risikovillig*: Vent-og-se

# Nytten av fleksibilitet er størst når lastutviklingen er usikker

Statistisk lastmodellering gir bedre kontroll på risikoen ved nettplanlegging

Nettplanleggingsmodellen til CINELDI foreslår strategier med ulik risikoprofil

Målet er ikke alltid å utsette nettinvesteringer – men fleksibilitet og aktive tiltak kan hjelpe med å håndtere risikoen bedre i ledetiden.
